

Assessment and treatment of laryngeal airway and voice disorders during COVID-19

The COVID-19 outbreak is significantly impacting the way we deliver laryngology and voice services. In many services “non-essential” laryngoscopies have discontinued until control of the outbreak is reached and ENTs are slowly being pulled into more critical services. To support clinicians during this time, the Dr Liang Voice Program at the University of Sydney is running a free webinar on possible solutions to help provide ongoing care for our patients during this period.

This webinar will present information on alternative service delivery models for assessment and treatment of voice and laryngeal airway disorders, utilising Telehealth and referencing the Speech-Language Pathology First Contact assessment model.

Date :

Tuesday 14th April, 2020

Time :

8-9.30pm AEST

To register visit:

<https://tinyurl.com/ru9rp7y>

Program Info :

- Chris Payten (Gold Coast University Hospital) – Telehealth Voice Assessment Framework using the SLP First Contact Model.
- A/Prof Daniel Novakovic (University of Sydney) - Thrown into the deep end - ENT Telehealth triage of laryngeal problems and remote monitoring of subglottic stenosis patients.
- A/Prof Cate Madill (University of Sydney) – Protocols and suggestions for delivering assessment and therapy for voice and laryngeal airway disorders via Telehealth.
- Professor Tricia McCabe (University of Sydney) - Tools for assessment and decision making through Telehealth and tips for using different Telehealth platforms.
- Followed by an open forum question and answer session for discussion and sharing of ideas.
